 - iii) Who wrote the board is a mystery.
 - iv) I remember the school where I studied for seven years.
 - v) The teacher wondered at what he saw in the classroom.
 - vi) The food provided to us was unhealthy.

Q3) Identify the cohesive devices giving their types in the following passage. [4]

When my husband and I were engaged, he informed me, with a twinkle in his eye, that he wanted to introduce me to his 'girlfriend'. Puzzled, I knew he was up to something. We went next door and were greeted by the sweetest old lady name Alta. I immediately figured it out. Alta was in her 90s, yet she had a quick mind and an equally quick wit. I instantly fell in love with her and could see why she was my husband's other 'favourite' girl. He saw her planting tulips in the rain one day, 10 years ago and decided to offer some assistance. That was the beginning of their weekly Sunday dates—he would sing her songs on his guitar and she would make him rice pudding. They would talk about the week's events and enjoy their time together.

Q4) A) Identify the mode (speech or writing) of the given discourse by giving at least two characteristics. [4]

Hello, This is Rahul Tiwari from HDFC Life Insurance Satara branch.
Am I talking to Mr. Suhas Desai?

I'm afraid. Mr. Desai is out of station. Is there any message for him?
May I know who I'm talking to?

My name is Priya and I'm his personal assistant.

Miss Priya let Mr. Desai know that his Term policy mandate form has been rejected. Just ask him to visit the branch with another mandate form.

O.K. Sir. Good day.

Good day.

- B) Identify the register/ domain of the discourse giving two characteristics.[4]

In studying the phenomenon usually referred to as sleep, we are actually dealing with more than one phenomenon. In point of fact, we spend the night alternating between two different types of sleep, each with different brain mechanisms and different purposes. As a person falls asleep, his brain waves develop a slower and less regular pattern than in a waking state. This is called orthodox sleep. In this state the brain is apparently resting. Its blood supply is reduced, and its temperature falls slightly. Breathing and heart rate are regular. The muscles remain slightly tensed. After about an hour in this state, however, the brain waves begin to show a more active pattern again, even though the person is apparently asleep very deeply. This is called paradoxical sleep because it has much in common with being awake. Paradoxical (active) sleep is marked by irregular breathing and heart rate, increased blood supply to the brain, and increased brain temperature. Most of the muscles are relaxed. There are various jerky movements of the body and face, including short bursts of rapid eye movement (REM's), which indicate that we are dreaming. Thus, we spend the night alternating between these two vital "restoration jobs": working on the brain (paradoxical sleep) and working on the body (orthodox sleep.)
